

Above Architectural door hardware was supplied by Ingersoll Rand Security Technologies. The company worked alongside the architect to establish the form and function of the door hardware, and also the security consultant to ensure the mechanical hardware coordinated with the security systems.

Along with the increasing technical complexity of construction comes the need for compliance to fire and disability codes. This in turn means it becomes important to specify appropriate door hardware products.

Ingersoll Rand Security Technologies, a global provider of products engineered to make a building safe and secure, used their expertise and world-class products and brands to provide the Auckland Business School with a total hardware solution.

Through collaboration with the architect, contractor and security consultant, Ingersoll Rand was able to ensure the aesthetics of the door hardware correlated with the overall look and feel of the building, while verifying that the mechanical hardware coordinated with the security system.

To do this, Ingersoll Rand prepared a detailed door hardware schedule, which incorporated products designed and manufactured in New Zealand to specifically meet the needs of the local market. This was made possible by Ingersoll Rand Security Technologies' local manufacturing operation.

As a company, Ingersoll Rand is committed to providing products and services of a high quality. Its services encompass elements of design, specification and manufacture, resulting in a total door hardware solution.
